

Doctor's Note

Date: June 15, 2024

Patient Name: John Doe

Date of Birth: January 1, 1985

Diagnosis: Acute Sinusitis

To Whom It May Concern:

John Doe was seen and evaluated at our clinic on June 15, 2024, and has been diagnosed with acute sinusitis. This condition is characterized by inflammation and infection of the sinus cavities, which has resulted in symptoms including nasal congestion, facial pain, headache, and fever. Upon examination, Mr. Doe presented with significant tenderness in the maxillary sinuses and purulent nasal discharge.

To manage and alleviate these symptoms, I have prescribed the following medications:

1. **Amoxicillin-Clavulanate (Augmentin)** 875 mg/125 mg, to be taken twice daily for 10 days, to treat the bacterial infection.
2. **Pseudoephedrine (Sudafed)** 60 mg, to be taken every 4-6 hours as needed for nasal congestion.
3. **Ibuprofen (Advil)** 400 mg, to be taken every 6-8 hours as needed for pain and fever reduction.

Mr. Doe is advised to rest, stay hydrated, and use a saline nasal spray to help relieve nasal congestion. He should follow up with his primary care physician in 7-10 days or sooner if symptoms worsen or fail to improve. If there are any questions or further clarification needed, please feel free to contact our office.
